

2nd Life Rain Barrels

Rain Barrels, Water Tanks, Cisterns, Catch Basins-No matter what you call them, they all catch rain. But the similarity ends there. Here in Texas, we value our water and want to save all we can while not denying ourselves it's intelligent use.

Please take a look at all of the features we can provide to make your rain water usage both attractive and easy.

Lid Style

The lid is flat and firmly attached to the rain barrel with a lever-lock ring. The openings in the lid are covered with mosquito prevention screen and provides for more than enough rainwater to flow through the opening from downspouts. The screen is reinforced with metal wire mesh for extra support. The screen keeps out mosquitoes and large organic debris. The lever-lock ring makes the rain barrel child and animal resistant. The lid can be removed for easy cleaning.

These rain barrels can be used to collect and store rainwater, gray water, and recovered household water. These products have enjoyed a previous life as food and liquid containers and are ready to begin their second life. These FDA food grade handling products have been selected for early retirement and look forward to new adventures! So instead of buying new barrels and drums, purchase these to keep recycled materials out of the land fill. These rain barrels have a drain valve at the bottom with garden hose threads, a removable screen lid, and an 1-1/2" internal overflow. The screened lid keeps out mosquitoes, organic debris, small animals, rodents, birds, and large particles. Blue is the only color available, but spray paint for plastic is available at hardware stores. You can paint them any color you desire! The lid can be removed to clean the inside of the barrel. The dark blue color also provides the means to curb algae growth! An elevated spigot can be added to fill up your watering pail to water indoor plants. Also available are fittings to mate several of these barrels together with companion tanks to increase the storage capacity.

This handy fitting is optional and allows the option of a second overflow or a means to mate one rain bar-

The internal overflow provides the necessary release of excess water while remaining invisible on the outside. It is 1-1/2 inch PVC which is adequate for overflow capacity. The overflow fitting couples to 1-1/2 inch male pipe fittings.

Specs

- 39" in height
- 24" in diameter at top
- 19.5" in diameter at bottom
- 25 pounds

Locally represented and provided by:

An optional valve is located 16" off the ground to help you fill buckets and watering cans. It has Garden Hose Threads on its outlet.

The bottom one allows you to wash any dirt or debris through it without taking it off the tank. It also has garden hose threads, of course!
